1. Introduction

- Mutsu interim spent fuel storage facility in Japan is preparing for the maximum 50-year storage of spent fuels in dry metal casks for both transportation and storage.
- To reduce risk of exposure to workers and waste materials, the facility has no hot cell, and <u>the spent fuels will be transported after the storage without</u> <u>opening the cask lid.</u>
- The Nuclear Safety Commission requested utilities to <u>accumulate</u> <u>knowledge and experience on long-term integrity of spent fuels during</u> <u>dry storage to ensure safety of post-storage transportation.</u>

Lots of demonstrations & experiences in overseas

Lots of fuel cladding integrity investigations in Japan

Dry storage experiences of BWR fuel in Japan

Demonstration test program for long-term dry storage in domestic research facility to accumulate knowledge and experience on longterm integrity of PWR spent fuels during dry storage.

To make assurance doubly sure on safety of post-storage transportation.

2. Overview of Demonstration Test Program

Purpose:

To demonstrate integrity of PWR spent fuels in long-term dry storage prior to future post-storage transportation

Test Period:

Maximum 60 years from the beginning of demonstration test

Method:

Maximum 2 PWR spent fuels are stored in a test container whose environmental conditions are simulated those in actual casks. Integrity of spend fuels is verified by analyzing gas sampled periodically from cavity of test container.

3. Organization of Demonstration Test Program

4. Planning Test Program (1)

| Fiscal year | 2009 | 2010 | 2011 | 2012 | 2013 -2022 | 2023 -2032 | 2033 -2042 | 2043 -2052 | |

4. Planning Test Program (2) ~Fuels used for Test~

- Max.2 spent fuels (48GWd/t and 55GWd/t) will be stored.
- 48GWd/t fuel : Some of the fuel rods were used for PIE test, and now it is stored in the pool of the hot laboratory at NDC.
- 55GWd/t fuel : spent fuels meeting the below assumption will be tested in the future.

| | Type 17×17 48G Fuel | Type 17×17 55G Fuel |
|-------------------|-----------------------------------|--|
| Burn-up (MWd/t) | 42,800 (past record) | 55,000 (assumption) |
| Cooling period | 19 years (as of October, 2012) | <u>>10 years</u> (as of October, 2022) |
| Cladding material | Zircalloy-4 | MDA or ZIRLO |
| Remarks | 15 empty fuel rods* | Non |
| | | |

Fuels Assumed for Tests

*Fuel rods used in PIE are never used for long-term storage tests.

4. Planning Test Program (3) ~Outline of Test Container~

4. Planning Test Program (4)

~Verification Method of Fuel Integrity~

4. Planning Test Program (5)

~Process of Fuel Handling and Test Container Installation~

4. Planning Test Program (6)

~Confirmation during storage tests~

Gas sampling

- Confirmation for detecting fuel leakage
- Inert gas sampled using a sampling pod
- Scheduled every 5 years
- Radioactive gas (Kr-85) analysis with a Ge detector
- Gas components analysis with a mass spectrometer

Temperature monitoring

- Estimating temperature history of fuel rods
- Thermocouples are installed on the outer surface in the middle area.
- Temperature of the fuel rods is calculated by a previously-verified assessment tool by thermal performance test.

4. Planning Test Program (7)

~Confirmation during storage tests (continued)~

Pressure monitoring

- Confirmation for maintenance of containment of the test container
- Monitoring of helium gas pressure at the lid boundary.
- Pressure gauges installed to buffer tank leading to gap of double metal gaskets.

Visual inspection

- Confirmation for no abnormality on the test container

- Visual inspection of surface of the test containment and its fixing condition.

5. Designing of Test Container (1) ~*Current Knowledge and Experience*~

Evaluation of Degradation Events

| Conditions to be considered | Technical Background | Actual Storage Condition | Target Test Conditions |
|-----------------------------|--|--|--|
| Thermal degradation | No embitterment due to hydride reorientation, failure due to creep strain, recovery of irradiation hardening, or stress corrosion crack <u>under 100MPa or less</u> <u>circumferential stress at 275 °C</u> | Around 230 °C (Gradually decrease with decrease in decay heat) | Around 230 °C (Gradually decrease with decrease in decay heat) |
| Chemical degradation | Negligible oxidation/hydrogen absorption during storage (<i>inert gas</i> <i>atmosphere</i>) compared to that during in-core irradiation | He gas atmosphere Moisture: 10% or less | He gas atmosphere Moisture: 10% or less |
| Radiation degradation | Negligible neutron irradiation influence during storage Saturation of mechanical strength due to neutron irradiation at relatively <u>low burn-up (around</u> <u>5GWd/t)</u> | Burn-up of stored fuel: <u>Maximum 47GWd/t</u> | Burn-up of contained fuel: <u>5GWd/t or more</u> |
| Mechanical degradation | Maintenance of integrity under normal test conditions of transport (free drop) (<u>Acceleration :20 to 45G</u>) | During storage: static position During earthquakes: <u>Acceleration of 1G</u> | During storage: static position During earthquakes: <u>Acceleration of 1G</u> |

5. Designing of Test Container (2) ~Simulated Environment of Actual Casks --- Temperature~

<u>Target Value of Fuel Cladding Tube Max.</u> <u>Temperature at Beginning of Test (static state)</u>

| Fuel | Design Value of Actual Cask (at environmental temp.) | Planned Value of Storage Test (at environmental temp.) | Limit |
|---------|--|--|-------------------|
| 48GWd/t | Up to 230°C (at 45°C) | Approx. 230°C (at 25°C) | <u><</u> 275°C |
| 55GWd/t | No assumption | Approx. 230°C (at 25°C) | <u><</u> 250°C |

5. Designing of Test Container (3)

~ Simulated Environment of Actual Casks --- Temperature ~

Heat Load of Fuels in Test Container

| Beginning of Test | | Addition of 55G Fuel | | |
|-------------------|--|---|--|--|
| Content | 48GWd/t fuel (cooling for 19 years) | 48GWd/t fuel (cooling for 29 years) & 55GWd/t fuel (cooling for 10 years) | | |
| Heat Load | 547 W | 1472 W (455+1017 W) | | |

Initial maximum temperature: Approx. 250°C at 48GWd/t fuel

5. Designing of Test Container (4)

~Simulated Environment of Actual Casks --- Test Atmosphere ~

- Test container is filled with <u>helium gas</u> having <u>negative pressure</u> <u>as with actual dry cask cavity.</u>
- Vacuum drying operation is carried out before backfilling of helium gas.
- > Amount of moisture is confirmed to be low.
- Residual moisture amount has <u>little effect on aging degradation</u> in terms of corrosion of cladding tubes and hydrogen <u>absorption.</u>

5. Designing of Test Container (5)

~Safety Analysis of Test Container~

- The test container satisfies safety functions (Shielding, Sub-Criticality, Containment, Heat Transfer, Structure) during the storage test.
- Thermal stress, handling and some accident are considered in structural analysis of the test container.

| Analysis | Calculating | | | Result | Criteria | |
|------------------|--|----------------|-------------------|---------------------------------|----------------------------------|-------------------------------|
| Shielding | Maximum expected dose rates | | | lateral side | 24.9 µ Sv/h | <u><</u> 25 µ Sv/h |
| Shielding | | | top side | | 144 µ Sv/h | <u><</u> 250 µ Sv/h |
| Criticality | Effective multiplication constant | | | 0.92 | <u><</u> 0.95 | |
| Containme nt | Nuclide release rates keeping vacuum during the storage test | | | 4.3×10 ⁻⁷ Pa∙m³/s | ≥1.0×10 ⁻⁹ Pa∙m³/s | |
| | Temperature of fuel and container | | 48 | GWd/t fuel | ~ 250°C | <u><</u> 275°C |
| Heat Transfer | | | 55GWd/t fuel | | ~ 230°C | <u>≤</u> 250°C |
| | | | Container surface | | \sim 50°C | <u>≤</u> 85°C |
| Structure | Stress | Thermal stress | | ealing boundary | 26MPa | <u>≤</u> 180MPa(Sy) |
| | | Handling | | oper Trunnion | 571MPa | <u>≤</u> 666MPa(Sy) |
| | | 0.5m Drop S | | ealing boundary | 55MPa | \leq 147MPa(Sy) |
| | | Seismic L | | wer Trunnion | 167MPa | <u>≤</u> 687MPa(Sy) |

5. Designing of Test Container (6) ~Heat Transfer Test Plan of Test Container ~

6. Summary

- Some PWR utilities are planning to conduct a <u>long-term storage test</u> for maximum 60 years by placing PWR fuels in a test container which simulates temperature and internal gas of actual casks to accumulate <u>knowledge and experience on long-term integrity of PWR spent</u> <u>fuels during dry storage</u>.
- The storage test plan such as <u>test methods and inspection items</u>, <u>safety analyses and container design have been prepared</u>. In the future, licensing and manufacturing of the test container are planned, and the <u>storage test of 48GWd/t fuel will start at late 2012</u>.
- Thermal design of the test container is important. Its <u>temperature is</u> <u>controlled with thermal insulators</u> and heat-transfer performance is confirmed by heat transfer tests at the completion of the container.
- ✓ Others ----- Japan Nuclear Energy Safety Organization (JNES) plans to participate in this test from a regulator's standpoint.
